

Goldfarb Lab Recieves Award For Studies on Autism Spectrum Disorder

Professor Goldfarb's lab is studying the potential contribution of two neighboring genes in causing autism spectrum disorder in individuals bearing deletions near the tip of Chromosome 22. In support of these studies, his laboratory has received a 3-year full research grant from the Simons Foundation Autism Research Initiative (SFARI). This research is being spearheaded by Res. Asst. Prof. [Michael Urbansk](#) i in the Goldfarb lab.
