

[Prof Carmen Melendez's](#) work was recently highlighted in a Multiple Sclerosis Research Program of Department of Defense

The booklet available [here](#) refers to work on Promoting Myelin Formation via Manipulation of Oligodendrocyte Cytoskeleton see pages 6-7

Also the group's paper on

Acute and chronic demyelinated CNS lesions exhibit opposite elastic properties was published in [Scientific Reports](#)

SCIENTIFIC REPORTS

OPEN **Acute and chronic demyelinated CNS lesions exhibit opposite elastic properties**

Wenwen Li, Vincent J. Storch, & Benjamin B. Bostelme ^{1,2} | [Carmen Melendez's](#) [Multiple Sclerosis](#) [Research Program](#)

Increased deposition of extracellular matrix (ECM) is a common feature of neural degeneration and repair. However, the mechanical properties of the ECM, including the mechanical properties of the myelin sheath, are not well understood. Here, we use a combination of mechanical testing and imaging to study the mechanical properties of myelin sheaths in acute and chronic demyelinated lesions. We show that the mechanical properties of myelin sheaths in acute demyelinated lesions are significantly different from those in chronic demyelinated lesions. These findings provide new insights into the mechanical properties of myelin sheaths and their role in neural repair.
